**Surname,  
First name** Smith,John

**DOB** 01-07-1984

**Sex** male

**Laboratory #** 3-4297

**Date collected** 01-30-2018

**Date received** 02-01-2018

**Report date** 02-09-2018

## Laboratory report

Enclosed you will find the results of your laboratory examination. In case of any positive results, please consult your primary care provider for treatment options and further analysis. We explicitly warn against beginning, suspending or changing any medication or therapy without consulting your doctor. Verisana recommends confirmatory testing with a different method for any positive result, or if an unexpected negative result is obtained. A positive result for any of the tests in this panel, should be viewed as a “presumptive positive” until a confirmatory test has been performed.

**Test:** HIV

**Sample material:** Blood

**Date received:** 02-01-2018

Analyte	Result	Reference range	Result
Human immunodeficiency virus (HIV)	detected	Not detected	

Human immunodeficiency virus: HIV 1 p24 antigen and/or HIV-1/HIV-2 antibodies were detected. HIV infects, and eventually destroys, important immune cells. There are varying symptoms of HIV depending upon the stage of disease. Most people with acute infection experience a short flu-like illness. After initial symptoms disappear, there is often a long, silent period of HIV infection before the disease progresses to AIDS. There is no cure to HIV, but early diagnosis allows for treatment with a
